

Shared management plan Blood pressure control (patients with diabetes or CKD and/or $ACR \geq 70$ mg/mmol)

PATIENT NAME:

BLOOD PRESSURE READINGS taken by patient at home	RECOMMENDED ACTIONS (Always check your BP again if unusually high)
<p><u>Below 70/50 mmHg</u></p> <p>Please note that if you send in a reading that is lower than an acceptable range, (e.g. you text 70/50 mmHg or lower), Flo will ask you to take your BP again.</p>	<p>ACTION - - If your blood pressure is a bit low, but you are not dizzy or fainting or unwell, this may not be a serious problem. But if it is still as low as 85/55 an hour later or you are very dizzy or unwell, you should call a doctor urgently today and they can talk through any symptoms you have and agree if you should be seen urgently.</p>
<p><u>Less than 125/75 mmHg</u></p> <p>Your blood pressure is under control when the top (systolic) measurement is less than 125 mmHg and the bottom (diastolic) measurement is less than 75 mmHg.</p> <p>We hope your blood pressure readings will be below 125/75 mmHg when you take them at home.</p>	<ul style="list-style-type: none">  ✓ Follow a healthy lifestyle.  ✓ Take plenty of exercise – half an hour walking each day, if you can.  For alcohol, women should not drink more than 14 units per week or 3 units in one day, and men no more than 21 units per week or 4 units in one day. ✓ Keep your weight down, and aim for a body mass index of less than 25.  If you smoke, think about stopping – ask at the practice if you would like support.
<p><u>No more than 170/105 mmHg</u></p> <p>Sometimes your blood pressure may be raised, and your reading may be as high as 170/105 mmHg.</p> <p>Although this is a high reading, it might settle without any further change to your medication if this is an unusual reading.</p> <p>If your blood pressure remains between 150/95 – 170/105 mmHg If it is between 125/75-149/94 mmHg</p>	<ul style="list-style-type: none">  ✓ Keep taking the tablets every day as your doctor has prescribed  ✓ Think if there is anything which might have made your blood pressure worse, and if you can identify it, take action to alter what has taken place. ✓ Were you angry or stressed? <p>Make an appointment with your GP or practice nurse in the next few days.</p> <p>⇒ Wait and see if it settles and go for your next usual blood pressure review.</p>
<p><u>Above 170/105 mmHg</u></p> <p>If your BP reading rises further: above 170/105 mmHg (that is above either 170 mmHg and / or 105 mmHg)</p> <p><i>Very high blood pressure could trigger a stroke, so it's important for a doctor to consider adjusting your tablets as soon as possible to lower your blood pressure.</i></p>	<ul style="list-style-type: none">  ✓ Stay calm. Try some relaxation techniques. Just sitting still and thinking about your breathing can help to calm you down. Or think about a relaxing time you've had in the past (e.g. holiday, long soak in the bath). <p>ACTION - If you repeat your blood pressure reading an hour later, and it's still as high, make an appointment to see your doctor or practice nurse within the next couple of days if it's just above 170/105 mmHg.</p> <p>ACTION - If your blood pressure reaches 175/105 mmHg, or even higher, and you confirm this is still as high one hour later, this is very high and you should contact a doctor urgently today. Phone the surgery, or if it's at night or the weekend phone the out of hours urgent contact number, so they can agree with you when you should be reviewed.</p>

Recommended actions included here are only suggestions: doctors / practices are welcome to alter any details in these messages to suit their own protocols. Please note that Flo is set up to issue an automated alert to the patient and clinician if the systolic BP is ≥ 200 mmHg, or the diastolic BP is ≥ 105 mmHg)
